Shipped game (UI/UX): [Magetender on Steam](#)

SUMMARY

Recent graduate (B.S. Computer Science: Computer Game Design, UC Santa Cruz, 2026) with hands-on experience across the full user-centered design cycle: observing real users, mapping workflows, and iterating through sketches, wireframes, and working prototypes based on direct feedback. Has designed and implemented UI for a shipped product, built a multi-role interactive prototype exploring shared-data information architecture, and collaborated cross-discipline with developers and artists on agile, team-based projects. Comfortable moving between low- and high-fidelity, and building working prototypes rather than stopping at mockups.

DESIGN SKILLS

User-Centered Design: contextual user research, workflow mapping, information architecture, wireframing, rapid & interactive prototyping, playtesting-driven iteration

UI / Visual Design: UI design & implementation, Shader Graph & VFX, custom control schemes for accessibility (controller support, virtual-mouse navigation), localization-aware UI, Blender, Adobe, LibreSprite

Build & Collaboration: Unity (URP), C#, HTML/CSS/JavaScript, React, Git/GitHub (4+ years), agile cross-discipline collaboration with developers and artists

UX & INTERACTION DESIGN PROJECTS

[Magetender — UI Design & Full Development Cycle](#) — Unity (URP), C#, live on Steam 2025 – Present

- Spent six months in an interdisciplinary team (art, design, engineering) taking the project through its full design cycle: concept, market research, UI and systems design, playtesting, and publishing, always grounding UI/UX decisions in who our players were and what they needed.
- Designed and implemented UI, including a custom Shader Graph-based meter that scales cleanly at any resolution, replacing an earlier sprite-based version.
- Owned accessibility design end-to-end: Spanish localization (interface and subtitles), full controller support with custom virtual-mouse navigation, colorblind-accessible UI, one-handed/touch control support, and sound accessibility.
- Validated accessibility features, including one-handed playability, through multiple rounds of testing across new implementations and game versions.
- Ran multiple rounds of playtesting with real users and iterated on combat pacing and interaction feel based directly on their feedback.

FlowDock — Multi-Role System Prototype — Independent Project

- Designed and built a working prototype modeling three roles (dispatcher, picker, packer) interacting with one shared data record, each with a purpose-built view tuned to that role's task and pace.
- Mapped role-specific workflows and defined a shared information architecture before building, then implemented it as a functioning interactive prototype rather than static mockups.
- Designed a persistent pipeline status view so overall system state stays visible no matter which role's screen is active, addressing a core IA challenge in multi-role software.

EXPERIENCE

Game Development Student — UC Santa Cruz, Baskin School of Engineering 2022 – 2026

- Studied and applied user-centered design techniques across coursework and independent research in systems design, interactive design, and software architecture.
- Contributed to team-based projects using agile workflows, Git version control, code review, and cross-discipline collaboration with artists and designers.

Web / React Projects — Independent Projects

- Built a practice site to demonstrate front-end and UX design skills, plus a side-scrolling platformer (Phaser/React) with custom UI and interaction design.

EDUCATION

B.S. Computer Science: Computer Game Design

University of California, Santa Cruz — specialization in game systems, interactive design, and UI/UX — 2026
